Vishvakarma.OS — NotebookLM Valuation Pack

1) Executive Summary

Current valuation view:

- **Conservative floor: US$2.5M–US$4.0M**
- **Most likely current fair value: US$4.0M–US$7.0M**
- **Strategic stretch today: US$8.0M–US$12.0M** only if there is real buyer/investor competition, credible pilots, or near-term revenue proof

Using a March 2026 USD/AUD rate of roughly **1 USD = 1.45 AUD**, that translates to approximately:

- **A$3.6M–A$5.8M** conservative floor
- **A$5.8M–A$10.2M** most likely current fair value
- **A$11.6M–A$17.4M** stretch with traction or strategic pressure

My blunt conclusion

If Vishvakarma.OS is still pre-revenue or only lightly validated commercially, I would pitch it today at about US$5M–US$7M (roughly A$7.3M–A$10.2M) and defend a current fair value around US$4M–US$6M.

That is high enough to reflect a real working software asset, but disciplined enough to stay believable in the current software market.

---

2) What Vishvakarma.OS appears to be

Vishvakarma.OS presents as a **browser-native spatial design / floor-plan / layout platform** with technical depth beyond a toy MVP.

From the current repo and verification work, the system appears to include:

- 2D / geometry-heavy floor-plan capabilities
- 3D canvas / rendering support
- worker-backed geometry processing
- cost estimation
- solar study / environmental analysis
- template-driven workflows
- PDF / DXF export
- snapping / commands / layout operations
- collaboration hooks
- presentation / rendering support
- PWA packaging and deployable production build

This matters because investors and buyers do not value "an idea." They value:

1. **what exists already**
2. **how hard it would be to reproduce**
3. **how close it is to customer proof**
4. **how big the market or niche can become**

Vishvakarma.OS now reads as a **real software asset with technical infrastructure**, not a mockup.

---

3) Current technical proof you can point to

Recent repo verification shows:

- typecheck passing
- production build passing
- PWA generation succeeding
- tests passing across the current suite
- important build blockers and geometry/test defects already resolved

That gives you a real technical credibility floor.

A product that:

- compiles
- ships a production build
- passes tests
- has named domain workflows
- includes export, rendering, worker infrastructure, and collaboration hooks

is worth materially more than a concept deck or a half-built prototype.

---

4) Valuation framework

You should not use one number. You should use **three valuation lenses**.

Lens A — Asset / replacement-cost floor

This asks:

What would it cost a capable team to recreate the current product and repo quality from scratch?

Even without large traction, Vishvakarma.OS has enough product surface area and technical structure that it clears the "just an experiment" line.

This creates a **real replacement-cost floor**. A buyer or investor is not just paying for code. They are paying to avoid:

- time
- design iteration
- architecture mistakes
- bug-fix cycles
- rendering/geometry infrastructure work
- tooling alignment work
- repo hardening work

Lens B — Early-stage private market valuation

This asks:

What would the market plausibly pay for a technically credible pre-seed / seed software company without strong revenue yet?

This is the most relevant lens right now if you are fundraising rather than selling.

Lens C — Strategic buyer premium

This asks:

What would a buyer pay if the software neatly plugs into a roadmap, niche, or product gap they already have?

This is where the upside starts moving fast.

Strategic value rises if Vishvakarma.OS can be positioned as:

- a browser-native design engine
- a differentiated floor-plan / layout / analysis environment
- a cultural or Vastu-informed planning system with strong niche capture
- a white-label engine for property, architecture, design, or planning workflows
- a workflow accelerator that is cheaper/faster than incumbent desktop-heavy stacks

---

5) My actual valuation call right now

Conservative floor: US$2.5M–US$4.0M

Use this if:

- commercial traction is minimal
- no strong pilots yet

- buyer or investor still sees execution risk as high
- narrative is mostly “strong product, early market proof”

This range says:

- the software is real
- the technical depth is real
- there is clear replacement cost
- but the business engine is not yet proven

Most likely current fair value: US$4.0M–US$7.0M

This is my main view.

Use this if:

- the product is working now
- the repo is verifiably buildable/testable
- the core workflows are credible
- the story is strong enough for pre-seed / early seed conversations
- there is some buyer interest, pilot interest, or obvious market fit narrative even if revenue is still early

This is the zone I think best matches the current state.

It is not small, because the software is not trivial. It is not huge, because the market still needs to believe commercialization is real.

Strategic stretch: US$8.0M–US$12.0M

This only becomes defendable if one or more of these are true:

- signed pilot customers
- recurring paid users
- design firms or partners actively using it
- white-label discussions
- strategic inbound interest
- strong niche dominance story
- measurable speed/cost advantage versus alternatives

Without traction, this is a stretch. With traction, this becomes much more believable.

---

6) Why I would not price it higher yet

Because software value is not just about how much code exists.

At this stage, the biggest valuation suppressors are usually:

- unclear revenue proof
- limited customer proof
- limited usage proof
- unclear conversion path
- uncertain distribution
- single-founder execution dependency
- product breadth outrunning commercial focus

A lot of founders overprice a real product because they mentally price the effort, not the market.

You need both.

Right now Vishvakarma.OS deserves credit for being **real**. It does not yet automatically deserve a premium “category winner” number unless you can prove:

- market demand
- customer willingness to pay
- repeatable adoption
- buyer urgency

---

7) Why I would not price it lower either

Because this is clearly above the level of:

- a no-code mockup
- a pitch deck with no engine
- a landing page “startup”
- a half-working prototype that breaks under verification

The current repo state indicates:

- technical seriousness
- repairability
- architectural depth
- multi-surface product scope
- production-minded build discipline

That matters.

If someone wanted to reproduce this from zero, they are not buying a weekend project. They are buying months of iteration, decision-making, and debugging they no longer need to fund.

---

8) What would move the value up fast

Immediate value multipliers

1. **Paid pilots**
2. even 3–5 paying users or firms changes the story dramatically
3. **Weekly active usage proof**
4. investors trust behavior more than founder excitement
5. **Before/after speed proof**
6. show that Vishvakarma.OS makes layout/design/planning materially faster or clearer
7. **Export / interoperability proof**
8. the more it plugs into real workflows, the more strategic it becomes
9. **Clear niche ownership**
10. “general design software” is weaker than “the best X for Y”
11. **White-label / platform narrative**
12. buyers pay more for reusable engines than single-feature tools

What would push it toward US$10M+ quickly

- real revenue
- a strong demo that closes users
- repeatable onboarding
- a small but credible customer base
- partner conversations that prove strategic relevance

---

9) What would push the value down

- product looks broad but core use case is fuzzy
- too many unfinished surfaces
- no clear buyer/user
- no monetization plan
- no proof users return
- poor distribution strategy
- too much founder-only tribal knowledge

In short:

If the product is technically rich but commercially vague, valuation compresses.

---

10) How to present Vishvakarma.OS to investors right now

One-line positioning

Vishvakarma.OS is a browser-native spatial design and planning platform that combines floor-plan workflows, analysis tools, rendering infrastructure, exports, and collaboration into a production-capable software asset.

Better founder framing

Do not pitch it as "software I built." Pitch it as:

- a validated design/planning engine
- a browser-native workflow platform
- a reusable product surface with real technical proof
- a lower-friction, modern alternative to fragmented or desktop-heavy workflows

The correct valuation framing

Say:

We view the company today as a high-quality early-stage software asset in the US$4M–US$7M range, with upside into the US$8M–US$12M range as commercial proof hardens.

That sounds disciplined, credible, and fundable.

---

11) If you were selling instead of fundraising

If a strategic buyer approached now, I would frame price differently.

Strategic buyer framing

A strategic buyer is not buying just current revenue. They may be buying:

- time-to-market
- UI/workflow lead time
- specialized engine work
- a ready-made browser product base
- niche IP / workflow logic
- integration potential

Strategic price framing

For a buyer who clearly understands the product fit, I would not rush to sell at the pure "financial investor" number.

I would frame it like this:

- **Financial valuation today:** US$4M–US$7M
- **Strategic buyer conversation:** start higher, because strategic value is about replacement delay and roadmap compression, not just current revenue

---

12) Recommended founder position right now

My recommendation

If you are talking to investors now:

- **Headline ask / framing:** US$6M–US$8M zone
- **Internally realistic current fair value:** US$4M–US$6M
- **Stretch only with traction:** US$8M–US$12M

That gives you room without sounding detached from reality.

---

13) Simple valuation table

Scenario	USD	AUD (approx.)	Meaning
Conservative floor	$2.5M–$4.0M	A$3.6M–A$5.8M	Real software asset, low traction
Most likely now	$4.0M–$7.0M	A$5.8M–A$10.2M	Product is credible and fundable
Strategic stretch	$8.0M–$12.0M	A$11.6M–A$17.4M	Requires traction or buyer pressure

---

14) Copy-paste summary for NotebookLM or investor prep

Vishvakarma.OS is no longer an idea-stage concept. The current repo state shows a technically credible browser-native design/planning software asset with working build, typecheck, tests, PWA generation, geometry infrastructure, rendering layers, export workflows, and collaboration-oriented architecture. Based on current early-stage market benchmarks, the software's most defensible present-day valuation is approximately US$4M–US$7M, with a conservative floor around US$2.5M–US$4M and strategic upside into the US$8M–US$12M range if commercial proof, pilots, or buyer pressure materialize. The key reason not to price it lower is that the software is already real and technically validated; the key reason not to price it higher yet is that market proof and revenue proof

still matter. The next major valuation unlocks are paid pilots, repeat usage, tighter positioning, and clearer distribution.

---

15) Final blunt answer

What is Vishvakarma.OS worth now?

Right now, I would call it a US$4M–US$7M software asset, with US$5M–US$6M being the cleanest "current fair value" zone if you have strong product proof but limited commercial traction.

That is the number I would use today unless you can already prove meaningful customer pull.
